

*Amendments to the Abstract of the Disclosure*

Please replace the Abstract of the Disclosure with the amended Abstract of the Disclosure set forth below:

~~A method for core lamination in a motor and a lamination structure thereof are in a motor~~ is constructed such that a plurality of lamination sheets which ~~is made by thin plate~~ of a predetermined shape are laminated ~~as a predetermined thickness~~ to form a laminated body, that is, a unit lamination core, ~~and the core~~. The unit lamination core ~~comprising~~ formed by the plurality of lamination sheets is fixedly coupled by a caulking portion or a coupling portion formed on the respective lamination sheet and connected with the adjacent lamination sheets to be in a row, ~~whereby an row~~. ~~In this way, a~~ fabricating process of the unit lamination core is made to be easy and simple to reduce time for fabricating, and a curvature for a curved surface portion of the unit lamination core can be changed so that the present invention can be applied to various motors according to the capacity or the size of the motor.
